

LAB EXPERIMENT RECORD

SET 12 — Website Traffic Analysis

Department	AIDS
Course Code / Course Name	DSA0602 / Data Handling and Visualization
Experiment	Data Visualization using R
Name	AKILA S
Register Number	192424331
Date	6 October 2026
Day	Tuesday

A. Aim

To analyze website traffic data using R by creating a line chart for daily page views, a bar chart for the top N days based on click-through rate, a website traffic table, and an interactive R Shiny dashboard.

B. Dataset

Website Traffic Dataset

Date	Page Views	Click-through Rate
2023-01-01	1500	2.3%
2023-01-02	1600	2.7%
2023-01-03	1400	2.0%

Program 1 — Line Chart for Daily Page Views

Aim

To create a line chart showing the trend in daily website page views.

R Code

```
# Website Traffic Data

date <- as.Date(c(
  "2023-01-01",
  "2023-01-02",
  "2023-01-03"
))

page_views <- c(
  1500,
  1600,
  1400
)

traffic_data <- data.frame(
  Date = date,
  Page_Views = page_views
)

# Create line chart

plot(
  traffic_data$Date,
  traffic_data$Page_Views,
```

```
type = "o",  
main = "Daily Website Page Views",  
xlab = "Date",  
ylab = "Page Views"  
)
```

Observation

The line chart shows the daily trend in website page views. Page views increased to 1600 on January 2 and then decreased to 1400 on January 3.\

Program 2 — Bar Chart for Top N Days by CTR

Aim

To create a bar chart showing the days with the highest click-through rate.

R Code

```
# Website Traffic Data
```

```
date <- as.Date(c(
  "2023-01-01",
  "2023-01-02",
  "2023-01-03"
))
```

```
ctr <- c(
  2.3,
  2.7,
  2.0
)
```

```
traffic_data <- data.frame(
  Date = date,
  CTR = ctr
)
```

```
# Sort data by CTR
```

```
traffic_data <- traffic_data[
  order(-traffic_data$CTR),
]
```

```
# Select Top 3 Days
```

```
top_n <- head(  
  traffic_data,  
  3  
)
```

```
# Create bar chart
```

```
barplot(  
  top_n$CTR,  
  names.arg = format(  
    top_n$Date,  
    "%Y-%m-%d"  
  ),  
  main = "Top Days by Click-through Rate",  
  xlab = "Date",  
  ylab = "Click-through Rate (%)"  
)
```

Observation

The bar chart shows that **2023-01-02** has the highest click-through rate of **2.7%**, followed by **2023-01-01** with **2.3%** and **2023-01-03** with **2.0%**.

Program 3 — Website Traffic Data Table

Aim

To create and display a table containing website traffic information.

R Code

```
# Website Traffic Data
```

```
traffic_data <- data.frame(  
  Date = as.Date(c(  
    "2023-01-01",  
    "2023-01-02",  
    "2023-01-03"  
  )),  
  Page_Views = c(  
    1500,  
    1600,  
    1400  
  ),  
  Click_Through_Rate = c(  
    2.3,  
    2.7,  
    2.0  
  )  
)
```

```
# Display table
```

```
traffic_data
```

```

# traffic_data
      Date Page_Views Click_Through_Rate
# 2023-01-01      1500             2.3
# 2023-01-02      1600             2.7
# 2023-01-03      1400             2.0
#
# |

```

Observation

The table displays the date, number of page views, and click-through rate for each day.

Program 4 — R Shiny Interactive Dashboard

Aim

To develop an interactive dashboard combining the line chart, bar chart, and website traffic table using R Shiny.

R Code

```
# Install package if required
```

```
# install.packages("shiny")
```

```
library(shiny)
```

```
# Website Traffic Dataset
```

```
traffic_data <- data.frame(
```

```
  Date = as.Date(c(
```

```
    "2023-01-01",
```

```
    "2023-01-02",
```

```
    "2023-01-03"
```

```
  )), Page_Views = c(
```

```
    1500,  
    1600,  
    1400  
  ),  
  CTR = c(  
    2.3,  
    2.7,  
    2.0  
  )  
)  
  
# UI  
  
ui <- fluidPage(  
  
  titlePanel(  
    "Website Traffic Analysis Dashboard"  
  ),  
  
  tabsetPanel(  
  
    tabPanel(  
      "Page Views",  
      plotOutput("lineChart")  
    ),  
  
    tabPanel(  
      "Top CTR Days",  
      plotOutput("barChart")  
    ),  
  )  
)
```

```

    tabPanel(
      "Traffic Table",
      tableOutput("trafficTable")
    )

  )
)

# Server

server <- function(input, output) {

  # Line Chart

  output$lineChart <- renderPlot({

    plot(
      traffic_data$Date,
      traffic_data$Page_Views,
      type = "o",
      main = "Daily Website Page Views",
      xlab = "Date",
      ylab = "Page Views"
    )

  })

  # Bar Chart

  output$barChart <- renderPlot({

```

```

sorted_data <- traffic_data[
  order(-traffic_data$CTR),
]

top_n <- head(
  sorted_data,
  3
)

barplot(
  top_n$CTR,
  names.arg = format(
    top_n$Date,
    "%Y-%m-%d"
  ),
  main = "Top Days by Click-through Rate",
  xlab = "Date",
  ylab = "Click-through Rate (%)"
)

})

# Traffic Table

output$trafficTable <- renderTable({

  traffic_data

})

}

```

```
# Run Shiny Application
```

```
shinyApp(  
  ui = ui,  
  server = server  
)
```

Website Traffic Analysis Dashboard

Observation

The R Shiny dashboard provides an interactive interface containing the daily page-view line chart, top CTR bar chart, and website traffic table. The dashboard allows the website traffic information to be viewed in multiple formats.

C. Overall Procedure

1. Create the website traffic dataset in R.
2. Store the date, page views, and click-through rate values.
3. Create a line chart to visualize daily page views.
4. Sort the data according to click-through rate.
5. Create a bar chart for the top N days.
6. Create and display the website traffic data table.
7. Develop an interactive R Shiny dashboard.
8. Add the line chart, bar chart, and table to the dashboard.

D. Result

The website traffic data was successfully analyzed and visualized using R. The line chart, CTR bar chart, traffic table, and R Shiny dashboard clearly represent the website traffic information.

The analysis shows that **2023-01-02 recorded the highest page views (1600) and the highest click-through rate (2.7%)** among the given dates.

E. Key R Functions Used

Function	Purpose
data.frame()	Creates the website traffic dataset
as.Date()	Converts values into date format
plot()	Creates the line chart
barplot()	Creates the bar chart
order()	Sorts data by CTR
head()	Selects the top N records
format()	Formats dates for display
library(shiny)	Loads the Shiny package
fluidPage()	Creates the Shiny interface
tabsetPanel()	Creates dashboard tabs
plotOutput()	Displays plots in Shiny
renderPlot()	Generates plots dynamically
tableOutput()	Displays the data table
renderTable()	Generates the table
shinyApp()	Runs the Shiny application
